# Chapter 1

## Useful links

- Course taught at Cornell is MAE5790. [Video lectures available on YouTube.](#)
- Textbook: nonlinear dynamics and chaos
- MIT course number: 18.385J / 2.036J Contains problem sets and some lecture notes which prove theorems.

# Chapter 2

## 1D flows

### 2.1 Logistic eqn

$$\dot{N} = rN(1 - \frac{N}{K})$$

### 2.2 Types of bifurcations

- Saddle node bifurcation/ Blue-sky: Fixed points appear.  $\dot{X} = r + X^2$
- Transcritical bifurcation: Fixed points switch stability.  $\dot{X} = RX - X^2$
- Pitchfork bifurcation: Appear in problems that have a symmetry.
  - Supercritical Pitchfork bifurcation:  $\dot{x} = rx - x^3$ . Cubic term is stabilizing, pulls system back towards  $x = 0$ .
  - Subcritical Pitchfork bifurcation:  $\dot{x} = rx + x^3$ . We will have a blow up since  $x^3$  pushes.
  - Subcritical Pitchfork bifurcation with stability:  $\dot{x} = rx + x^3 - x^5$ . (Solve 3.4.14, 3.4.15)
- Imperfect bifurcation, catastrophe

## **2.3 Flows on circle**

### **2.3.1 Uniform oscillator**

### **2.3.2 Nonuniform oscillator**

### **2.3.3 Overdamped pendulum**

### **2.3.4 Fireflies**

## **2.4 2D Linear flows**

## **2.5 2D Nonlinear flows**

### **2.5.1 Conservative systems**

### **2.5.2 Rabbit and Sheep**

### **2.5.3 Reversible systems**

### **2.5.4 Pendulum**

### **2.5.5 Index theory**

TODO: has links to alternate homology theories (Morse homology and singular homology. Read Morse homology sometime).
