6.8, Q1:

Monotonicity of VC dimension

Let $\mathcal{H}' \subseteq \mathcal{H}$. We wish to show that $\text{VCdim}(\mathcal{H}') \leq \text{VCdim}(\mathcal{H})$.

Recall that the definition of VCdimis is that $\text{VCdim}(\mathcal{H})$ is the maximal size of a set $C \subseteq \mathcal{X}$ which can be *shattered* by $\mathcal{H}$.

Expanding the definition of shattering, we get that the $\text{VCdim}(\mathcal{H})$ is the maximal size of a set $C \subseteq X$ such that $\mathcal{H}$ restricted to C is the set of all functions from C to $\{0, 1\}$.

Now, If $C \subseteq \mathcal{X}$ is shattered by $\mathcal{H}' \subseteq \mathcal{H}$, then this means that:

$$|\{f|_C : f \in H'\}| = 2^{|C|}$$

Since $\mathcal{H}' \subseteq \mathcal{H}$, we can replace $\mathcal{H}'$ with $\mathcal{H}$ in the above formula to arrive at:

$$|\{f|_C : f \in H\}| = 2^{|C|}$$

So, clearly, $\text{VCdim}(\mathcal{H}') \leq \text{VCdim}(\mathcal{H})$. However, there might be a set that is *larger* than C that can be shattered by $\mathcal{H}$. This lets us get the strict equality $\text{VCdim}(\mathcal{H}) < \text{VCdim}(\mathcal{H})$ in certain cases — that is, we *cannot* assert that $\text{VCdim}(H) \leq \text{VCdim}(H')$. For example, if we choose $\mathcal{H}' = \emptyset$ where $\mathcal{H}$ is a hypothesis class with $\text{VCdim}(\mathcal{H}) = 1$. Then $\text{VCdim}(\emptyset) = 0 < 1 = \text{VCdim}(\mathcal{H})$.
